**SalamatDoc: A Token-base Secured Treatment Compliance Monitoring System for Patient-Doctor Management**

Sitemap Diagram

The SalamatDoc web app contains a landing page with a login along with a description of the hospital (About Us) and its mode of contact (Contact Us). The user then logs in using either an admin/doctor or patient account.

The patient has their designated profile provided by the hospital; this can also be viewed or edited by their assigned doctor. After logging in, a patient can view their personal health calendar, which then allows them to access their daily intake monitor, daily meals checklist, and appointments.

The doctor / admin account has different features such as access to inserting prescriptions and diets into a patient's calendar. It also includes the general management and assigning of patients and editing their personal information.
